

Build your app with LangChain

Build context-aware, reasoning applications with LangChain's flexible framework that leverages your company's data and APIs. Future-proof your application by making vendor optionality part of your LLM infrastructure design.

LangChain is a framework for developing applications powered by large language models (LLMs).

LangChain simplifies every stage of the LLM application lifecycle:

Development: Build your applications using LangChain's open-source components and third-party integrations. Use LangGraph to build stateful agents with first-class streaming and human-in-the-loop support.

Productionization: Use LangSmith to inspect, monitor and evaluate your applications, so that you can continuously optimize and deploy with confidence.

Deployment: Turn your LangGraph applications into production-ready APIs and Assistants with LangGraph Platform.

The LangChain framework consists of multiple open-source libraries. Read more in the [Architecture page](#).

`langchain-core`: Base abstractions for chat models and other components.

Integration packages (e.g. `langchain-openai`, `langchain-anthropic`, etc.): Important integrations have been split into lightweight packages that are co-maintained by the LangChain team and the integration developers.

`langchain`: Chains, agents, and retrieval strategies that make up an application's cognitive architecture.

`langchain-community`: Third-party integrations that are community maintained.

`langgraph`: Orchestration framework for combining LangChain components into production-ready applications with persistence, streaming, and other key features. See [LangGraph documentation](#).
